

The background of the slide is a photograph of a massive open-pit mine. The mine's terraced levels are visible, showing the scale of the excavation. The sky is a vibrant blue with scattered white clouds. The text is overlaid on the upper half of the image.

# **Beyond Techno-Economics: Responsible Deployment in Carbon Management**

**Pete Psarras, Research Assistant Professor, SEAS/KCEP**  
**Penn Climate Week, October 10<sup>th</sup> – 14<sup>th</sup>, 2022**

# A brief history

2400 GtCO<sub>2</sub> (+/- 240 GtCO<sub>2</sub>)  
1850 <> 2019

We are  
here

1870 2050

# A brief history

Remaining Budget:  
500 GtCO<sub>2</sub>e (<1.5 °C, 50%)  
1150 GtCO<sub>2</sub>e (<2.0 °C, 67%)

# The challenge

## Reduce

Low-carbon energy  
(CSP, PV, wind,  
geothermal, nuclear,  
waste heat, biomass)

## Avoid

Point source capture

## Remove

Nature-based and  
Engineered methods

# Will it scale?

Climeworks "Orca" Plant  
cap. = 4,000 tCO<sub>2</sub>/yr.

# Decarbonizing the industrial sector

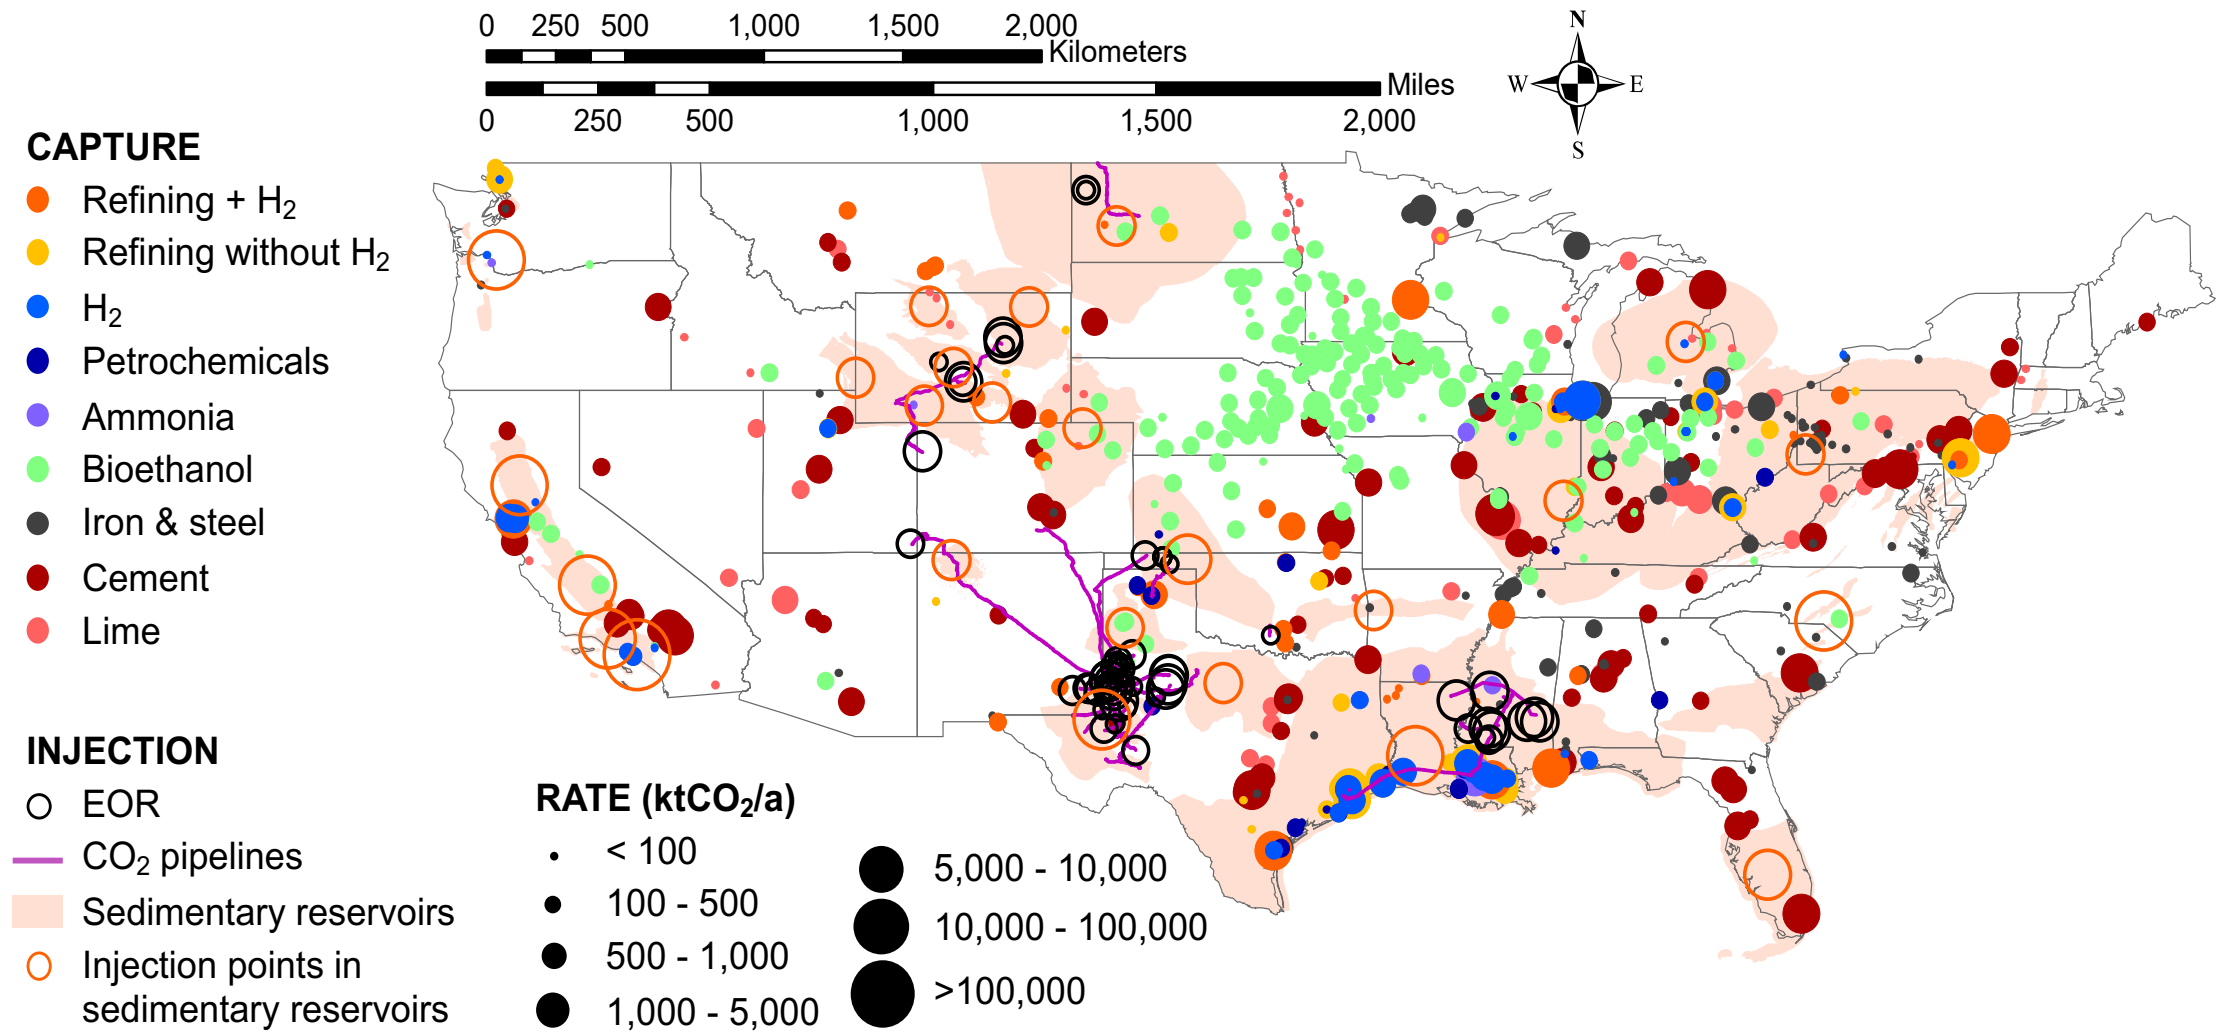

# Step 2: Avoid

| Commodity      | Chemistry  |
|----------------|--|
| Aluminum       | $2\text{Al}_2\text{O}_3 + 3\text{C} \rightarrow 4\text{Al} + 3\text{CO}_2$   |
| Ammonia        | $0.88\text{CH}_4 + 1.26\text{air} + 1.24\text{H}_2\text{O} \rightarrow 0.88\text{CO}_2 + \text{N}_2 + 3\text{H}_2$                               |
| Carbonates     | $\text{Ca/MgCO}_3 + \text{heat} \rightarrow \text{Ca/MgO} + \text{CO}_2$   |
| Cement         | $\text{CaCO}_3 + \text{heat} \rightarrow \text{CaO} + \text{CO}_2$   |
| Ethanol        | $\text{C}_6\text{H}_{12}\text{O}_6 + \text{yeast} \rightarrow 2\text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2 + \text{heat}$                       |
| Ferroalloys    | $\text{Fe}_2\text{O}_3 + 2\text{SiO}_2 + 7\text{C} \rightarrow 2\text{FeSi} + 7\text{CO}$  |
|                | $\text{Fe}_2\text{O}_3 + 2\text{MnO} + 5\text{C} \rightarrow 2\text{FeMn} + 5\text{CO}$  |
|                | $\text{Fe}_2\text{O}_3 + 2\text{CrO} + 5\text{C} \rightarrow 2\text{FeCr} + 5\text{CO}$  |
| Glass          | various components + heat $\rightarrow \text{CO}_2$ + glass  |
| Iron and Steel | $2\text{C} + \text{O}_2 \rightarrow 2\text{CO}$  |
|                | $3\text{CO} + \text{Fe}_2\text{O}_3 \rightarrow 2\text{Fe} + 3\text{CO}_2$   |
| Lead           | $2\text{PbO} + \text{C} \rightarrow 2\text{Pb} + \text{CO}_2$  |
| Lime           | $\text{CaCO}_3 + \text{heat} \rightarrow \text{CaO} + \text{CO}_2$   |
| Magnesium      | $2\text{MgO} + \text{C} \rightarrow 2\text{Mg} + \text{CO}_2$  |
| Petrochem.     | $\text{C}_2\text{H}_4 + 3\text{O}_2 \rightarrow 2\text{H}_2\text{O} + 2\text{CO}_2$  |
| H3PO4          | $\text{CaCO}_3 + \text{H}_2\text{SO}_4 + \text{H}_2\text{O} \rightarrow \text{CaSO}_4 \cdot 2\text{H}_2\text{O} + \text{CO}_2$                   |
| Pulp and Paper | wood organics + $\text{O}_2 \rightarrow \text{CO}_2$ ; $\text{CaCO}_3 + \text{heat} \rightarrow \text{CaO} + \text{CO}_2$                        |
| Refining       | $\text{CH}_{1.33}\text{O}_{0.43} + 0.26\text{O}_2 \rightarrow 0.65\text{CH}_{1.12} + 0.27\text{H}_2\text{O} + 0.34\text{CO}_2$                   |
| SiC            | $\text{SiO}_2 + 3\text{C} \rightarrow \text{SiC} + 2\text{CO}$   |
| Soda Ash       | $2\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O} \rightarrow 3\text{Na}_2\text{CO}_3 + 5\text{H}_2\text{O} + \text{CO}_2$ |
| TiO2           | $2\text{FeTiO}_3 + 7\text{Cl}_2 + 3\text{C} \rightarrow 2\text{TiCl}_4 + 2\text{FeCl}_3 + 3\text{CO}_2$  |
| Zinc           | $\text{ZnO} + \text{CO} \rightarrow \text{Zn} + \text{CO}_2$   |

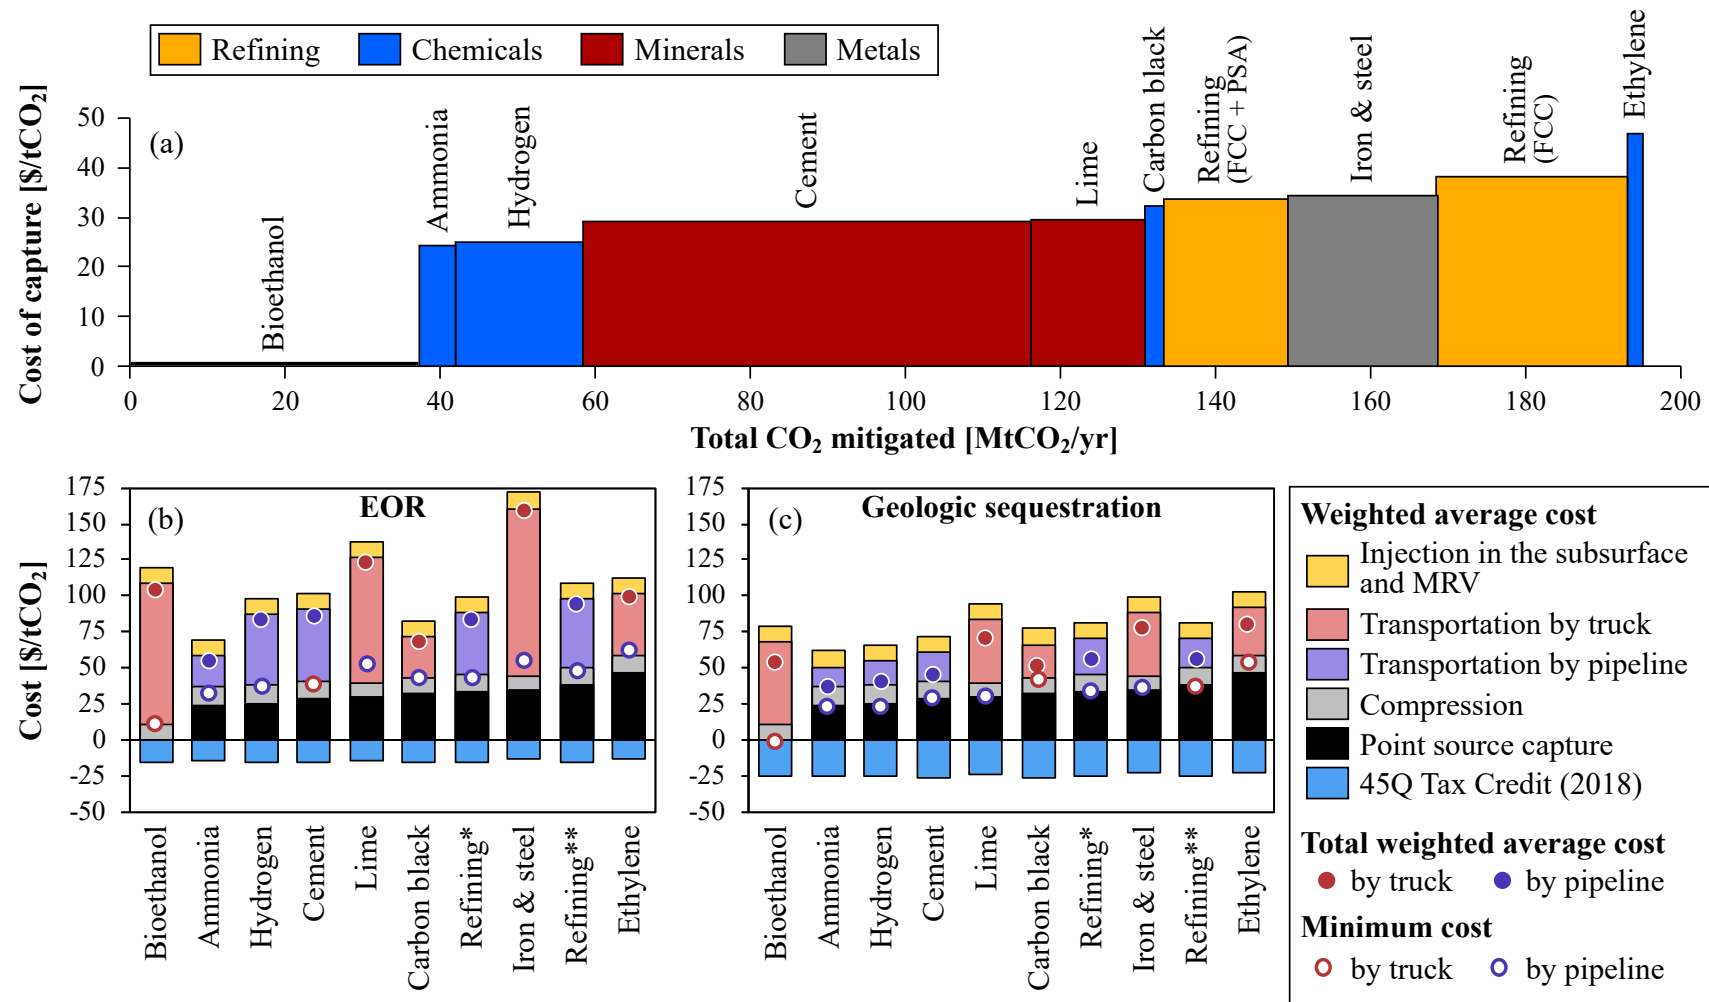

# A techno-economic picture of CCS deployment

# Transportation can significantly shift the merit-order of CCS

# Some industries are more challenging than others

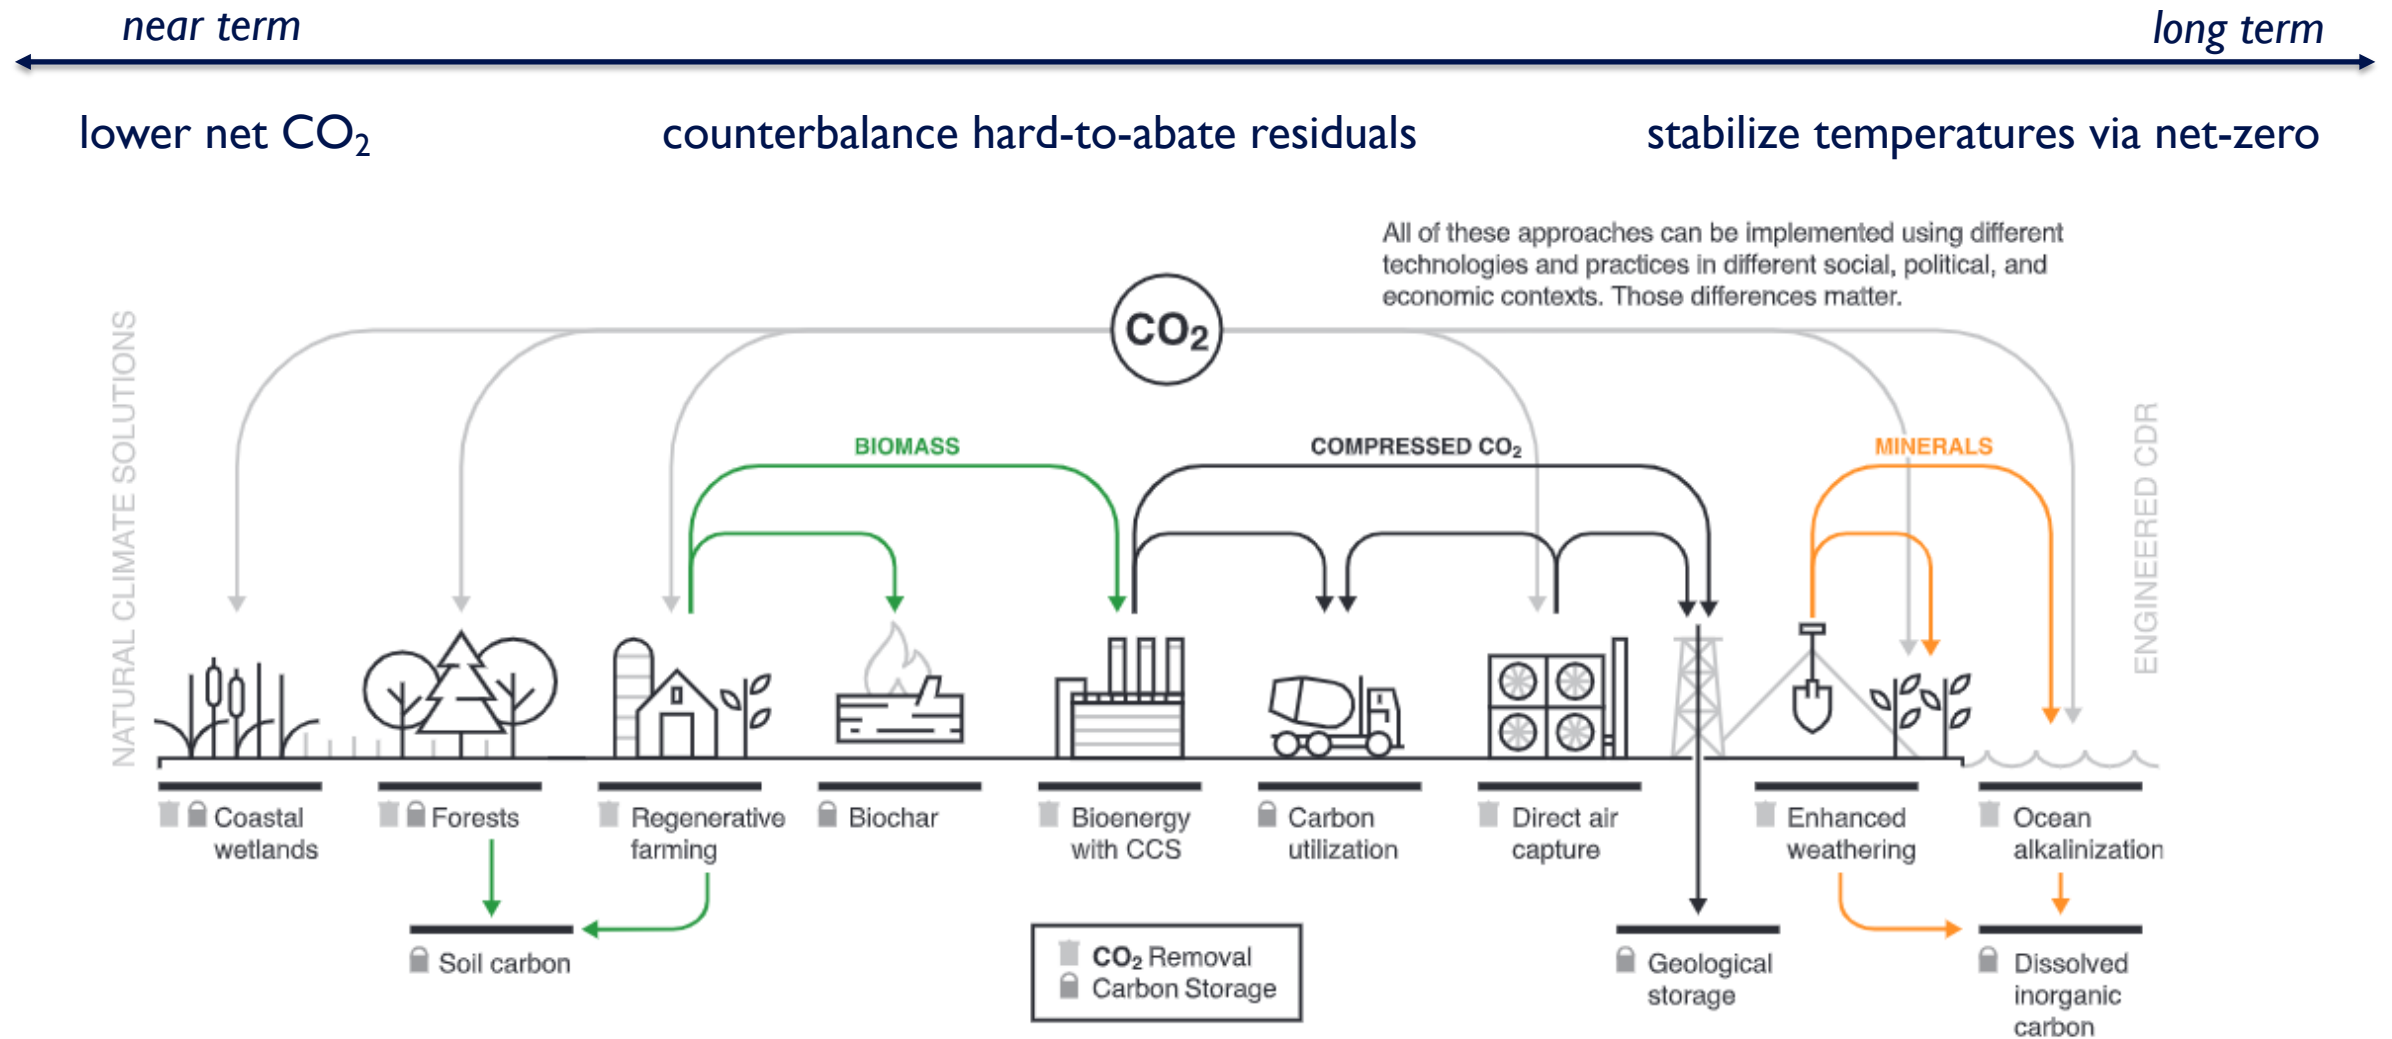

## Steel Production

## Cement Production

# Step 3: Remove

# Five principles for quality removal

---

## **I. Additionality and Baselines**

Baselines against which removals are measured should be set conservatively to avoid over-crediting.

Additionality : above and beyond what would have occurred naturally, eg without human intervention

# Five principles for quality removal

---

1. **Additionality and Baselines**

## **2. Durability**

High quality projects should show low risk of reversal through voluntary or involuntary means through 100 years at a minimum.

# Five principles for quality removal

---

1. **Additionality and Baselines**

2. **Durability**

**3. Leakage**

High quality projects should have minimal risk of displacing activities that would result in increased GHG release elsewhere, or at least account for such effects conservatively

# Five principles for quality removal

---

1. **Additionality and Baselines**

2. **Durability**

3. **Leakage**

**4. Carbon Accounting Method**

High quality projects quantify and monitor net carbon removal(and all GHG fluxes) repeatedly and through verifiable methods. Must be transparent about uncertainty

# Five principles for quality removal

---

1. **Additionality and Baselines**
2. **Durability**
3. **Leakage**
4. **Carbon Accounting Method**
- 5. Do no harm**

High quality projects must have low risk of any material negative impacts on surrounding ecosystems and communities

Q: Where should we place  
CDR projects?

A: Where are they technically and  
economically feasible?  
Where are they socially and  
environmentally acceptable?

# Direct Air Capture

# How should we think about land usage?

---

Divide land into “environmental exclusion categories”

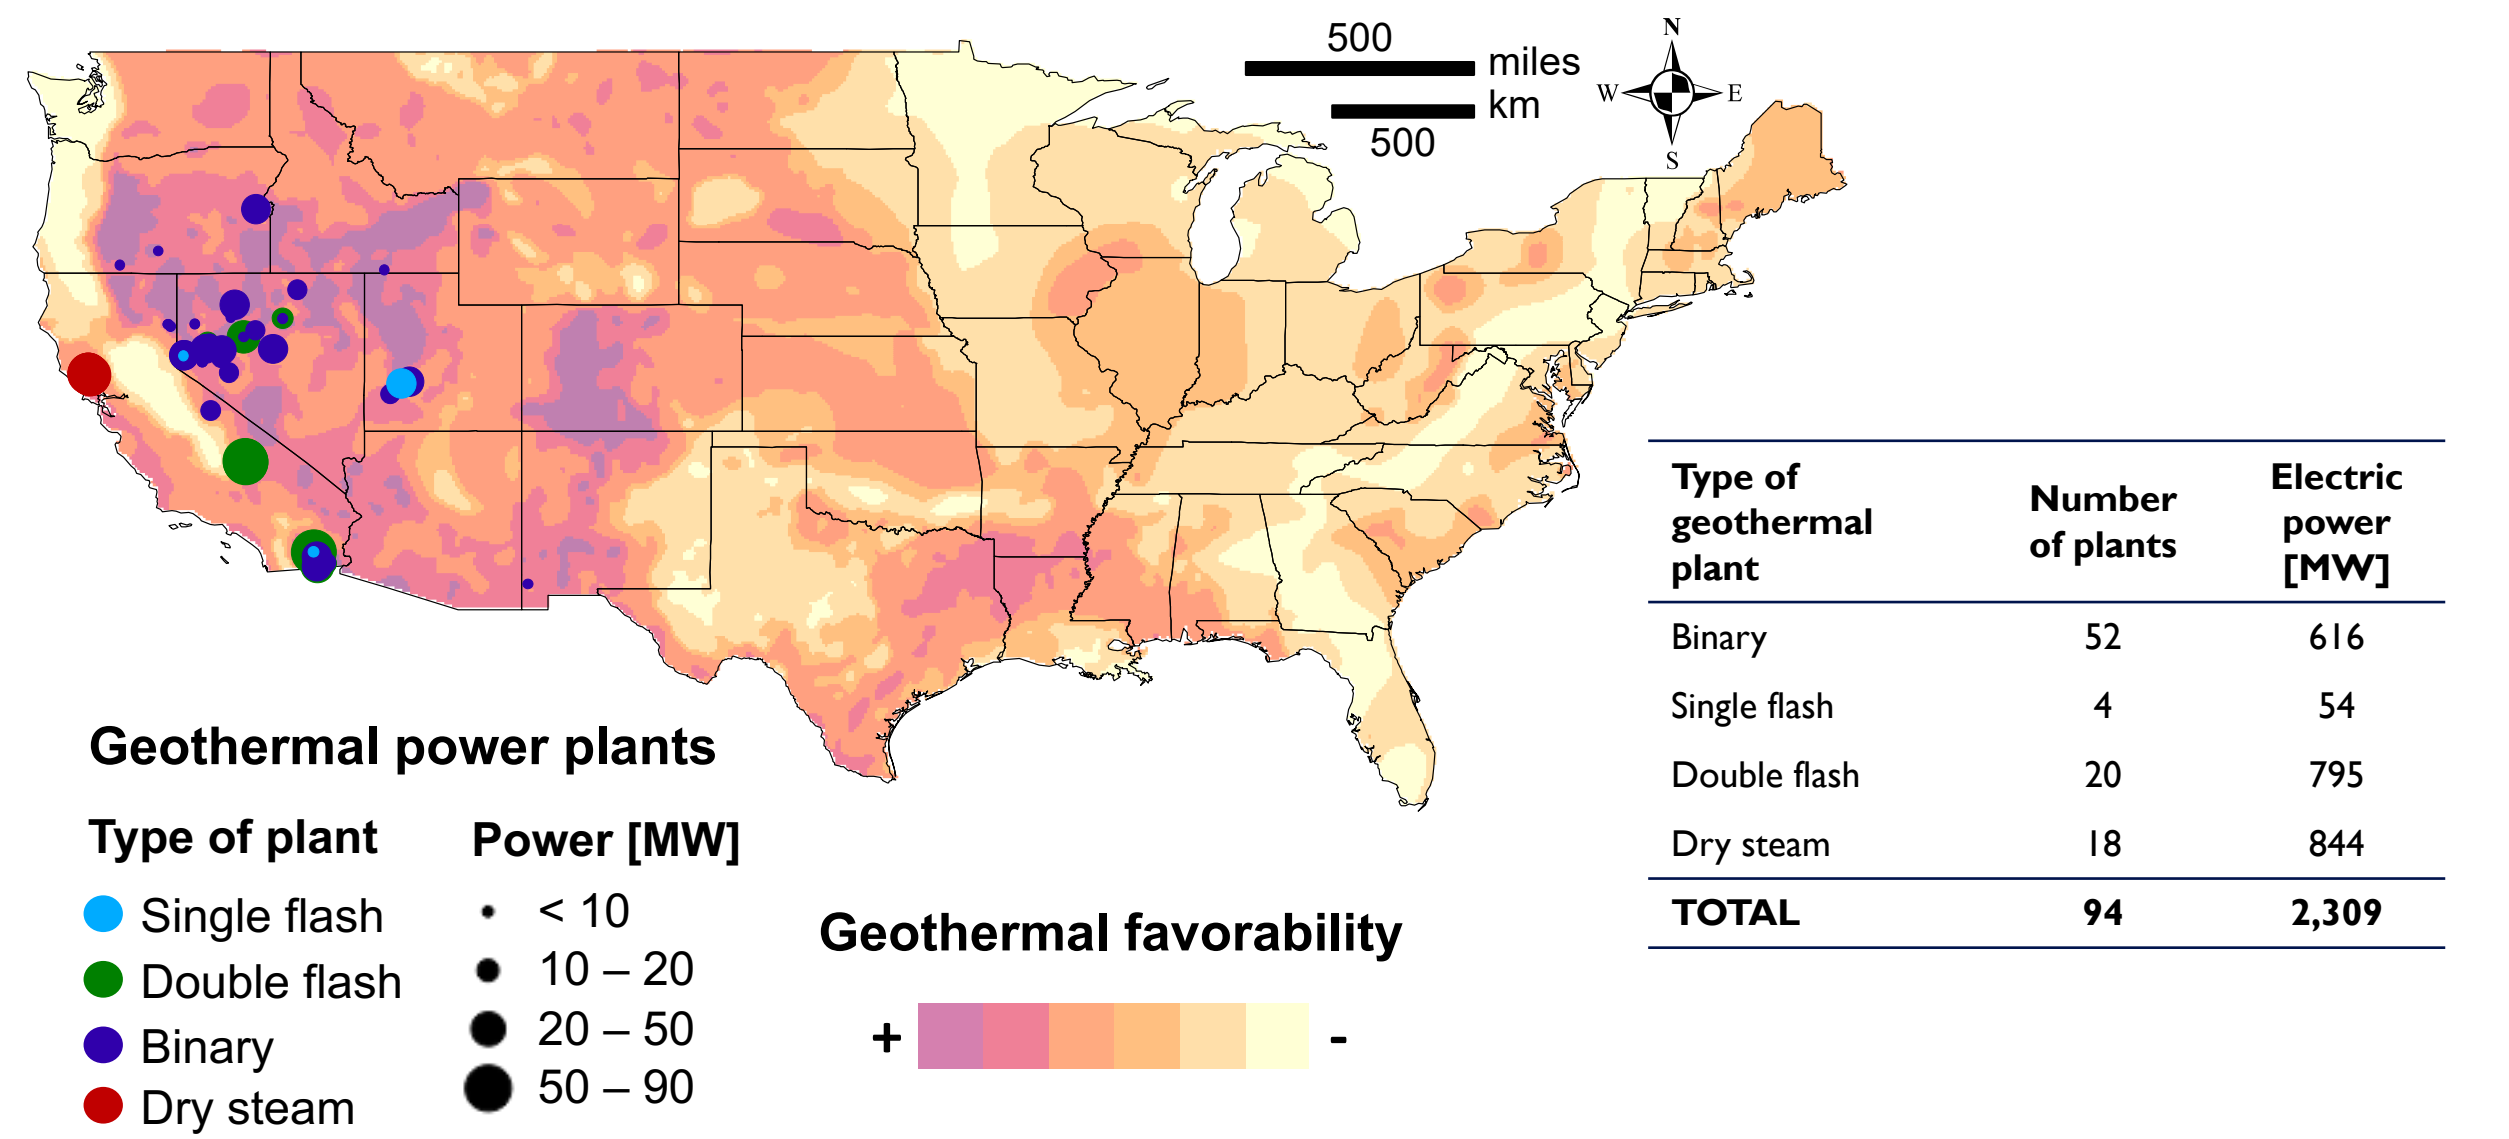

**Category 1 (Legally protected):** Areas with legal restrictions against energy development. Example: National Wildlife Refuge, National Parks

**Category 2 (Administratively protected):** Areas where siting requires consultation or review process to protect **ecological values, cultural values, or natural characteristics**. Examples: critical habitats for endangered species, tribal lands

**Category 3 (High conservation value):** Areas that have been determined through multi-state or ecoregional analysis to hold high social, economic or cultural value. Examples: Prime farmlands, important bird areas.

**Category 4 (Landscape intactness):** Example: wildlife corridors

# Revisiting optimal geothermal resource

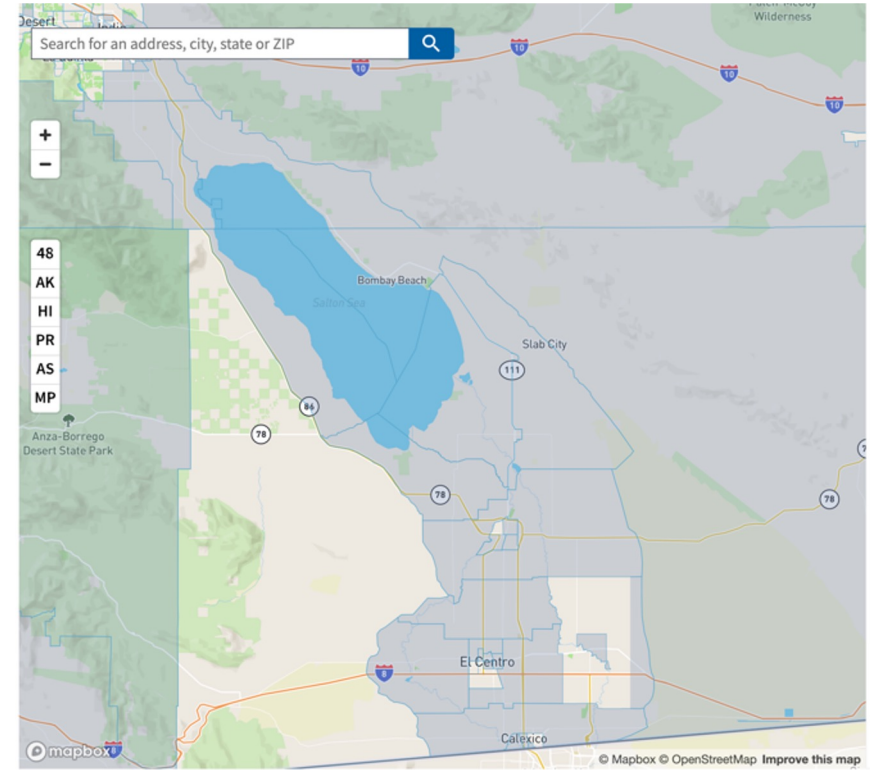

# Impacts can occur throughout the value chain

|                                 | Local  | Distributed   |
|---------------------------------|--|---|
| <b>One time:<br/>Pre-plant</b>  | Construction of plant (one time), construction material production, transport, labor   | Production of capture media, production of select construction materials, production of energy infrastructure   |
| <b>Ongoing</b>                  | Energy usage (fossil), chemical leakage or drift, transport of materials to/from plant, energy production, CO <sub>2</sub> use-related activities,* management of captured CO <sub>2</sub> ,* end-treatment of plant materials                                     | Distant supply chain stresses; production of capture media; production of electricity, transport, and management of captured CO <sub>2</sub> ,* end-treatment of materials* |
| <b>One time:<br/>Post-plant</b> | Decommissioning, destruction, post-site maintenance and remediation, destruction and disposal transport, economic loss, discontinuation of CO <sub>2</sub> use-related activities,* end-treatment of materials, residual infrastructure, post-management site care | Economic loss, end-treatment of plant materials, residual infrastructure, post-management site care   |

# Toward net-zero in 2050

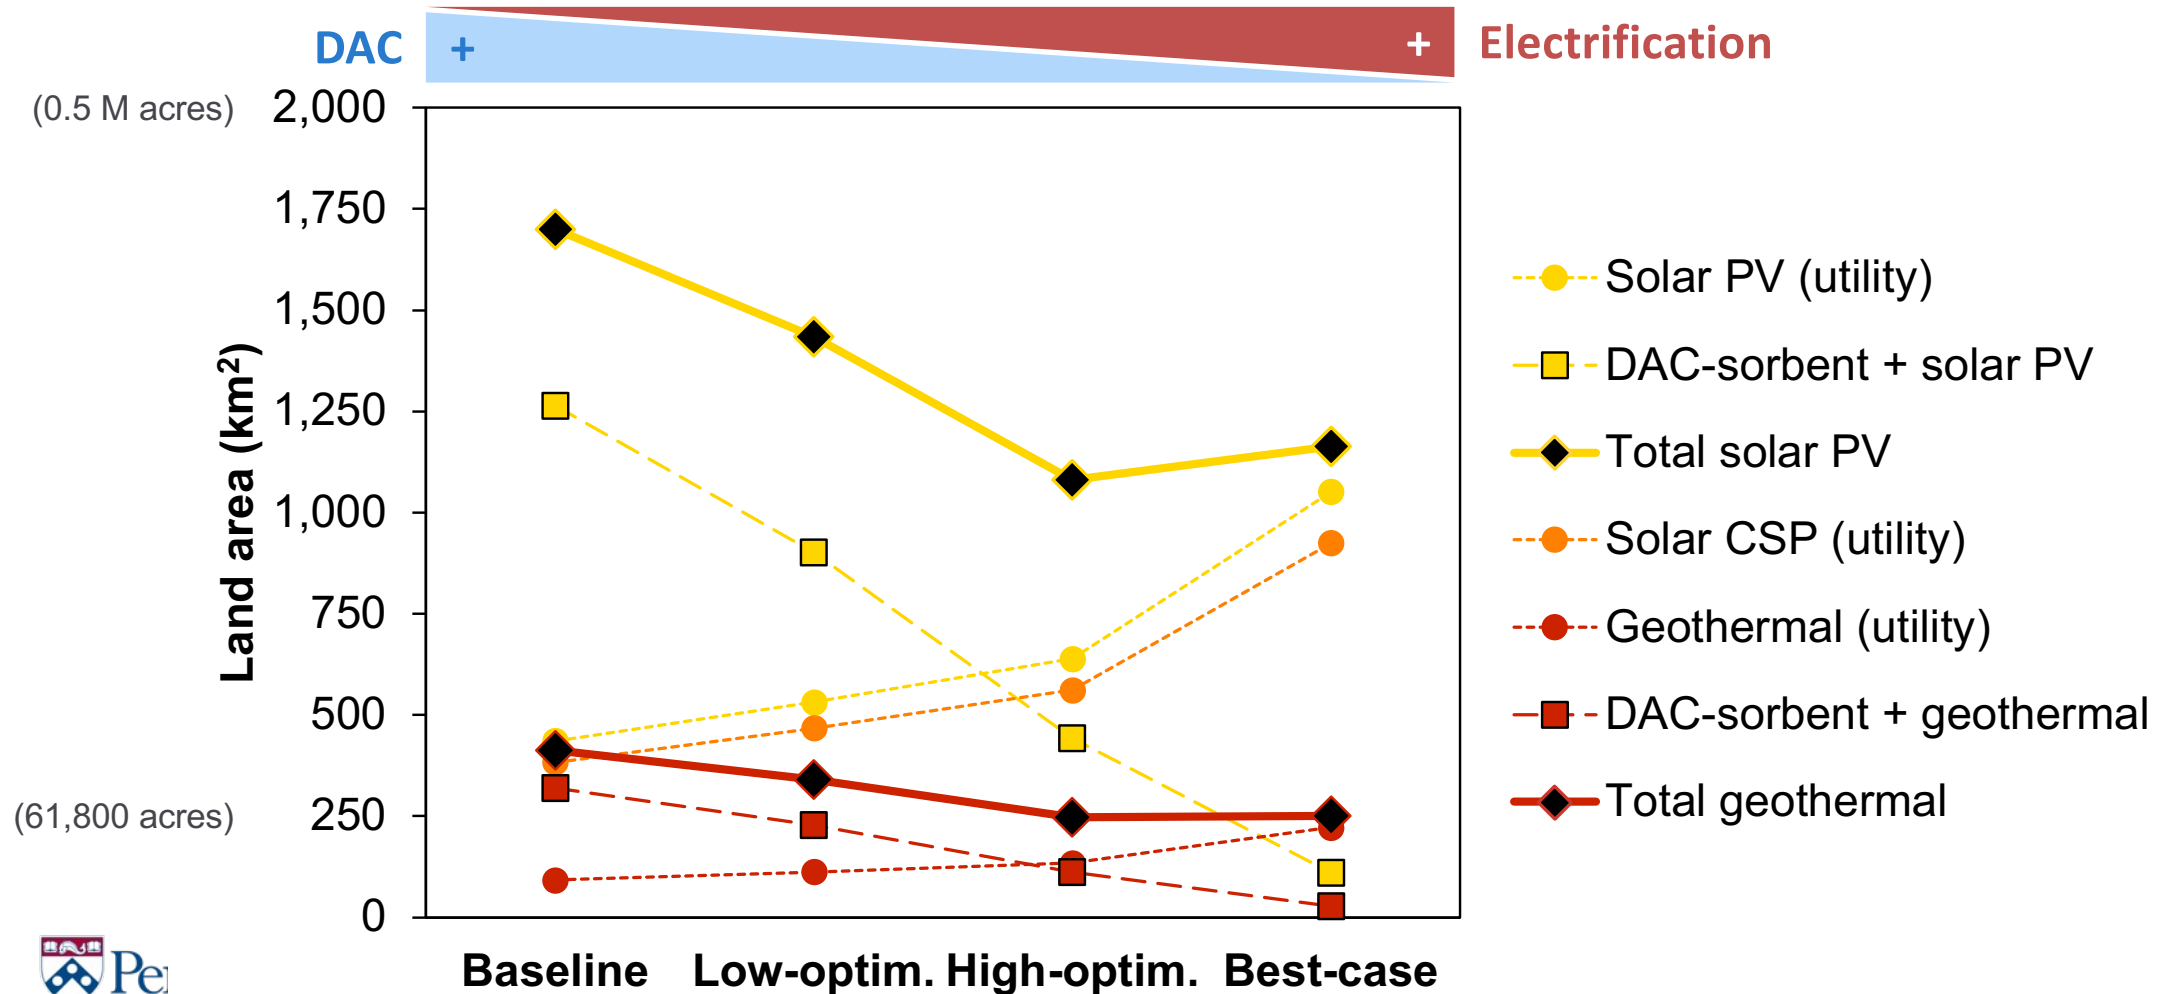

Red. = GHG emissions reduction; CC = carbon capture; DAC = direct air capture; Stor. = CO<sub>2</sub> storage

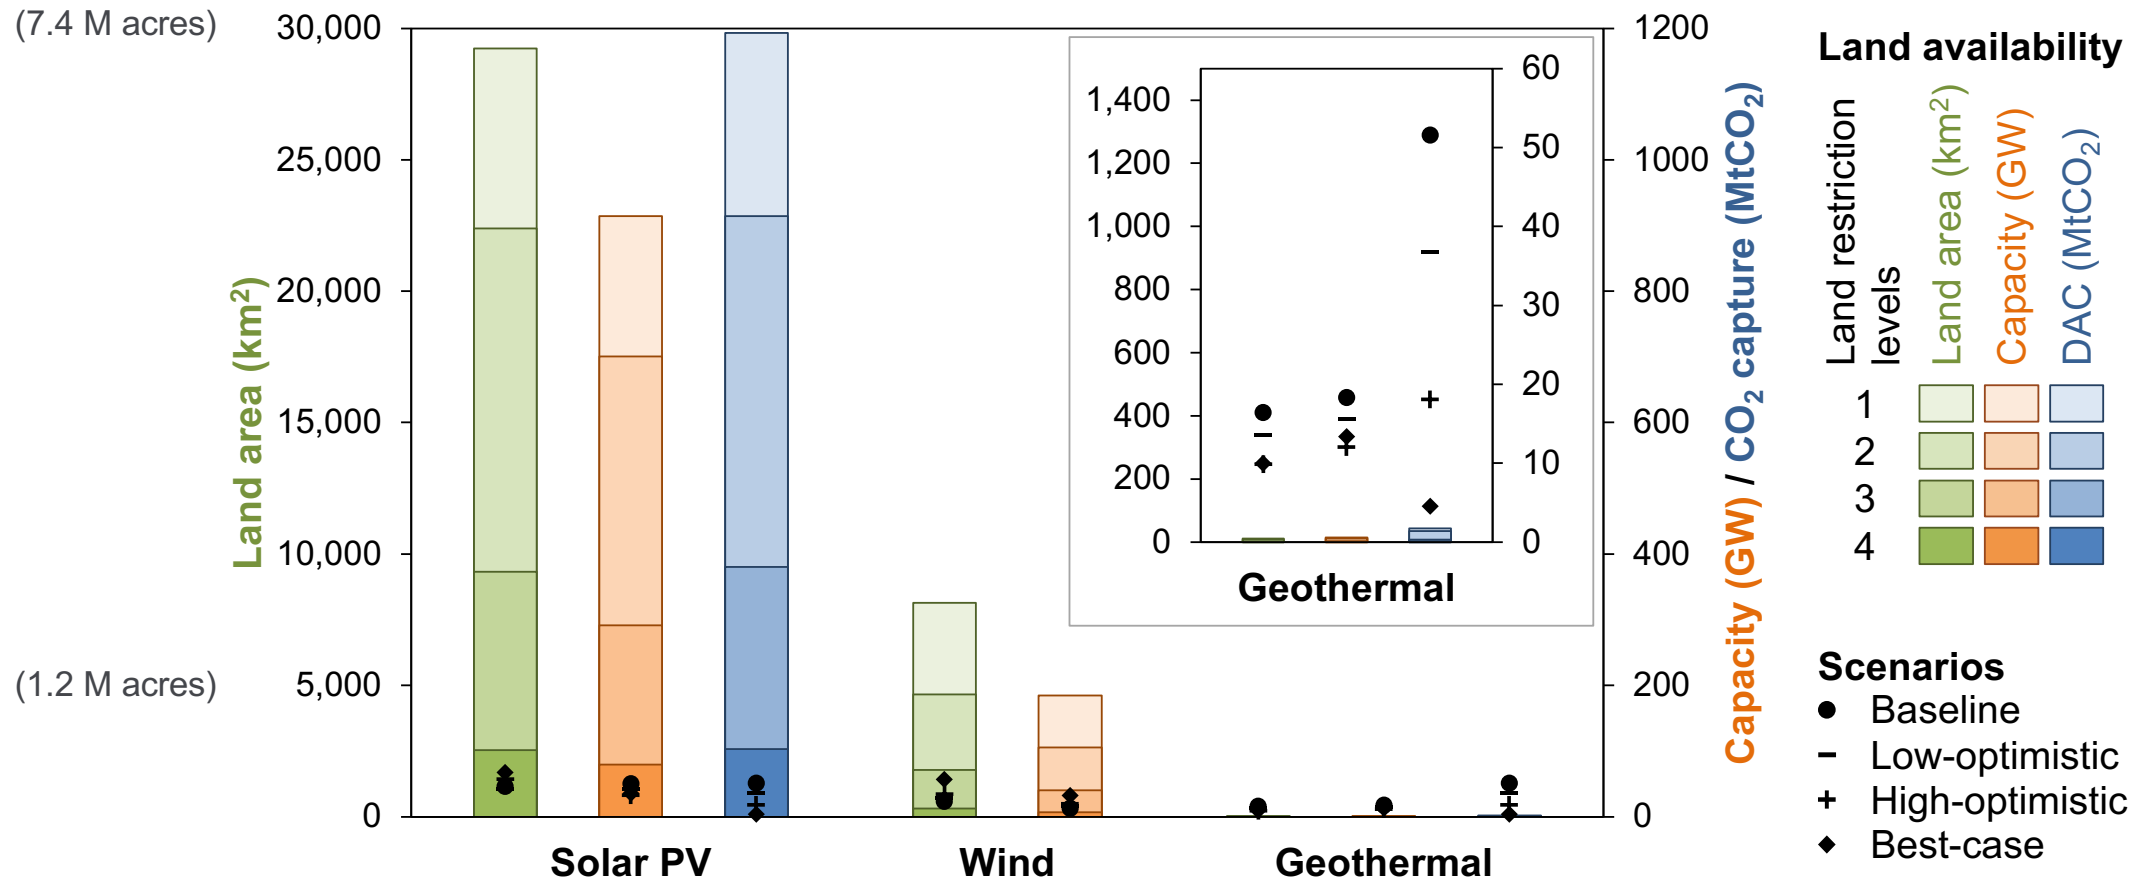

# Land area for utilities and DAC in 2050

Additional electricity generation needed for utilities in 2050: +157-227% compared to 2020

# Land area for utilities and DAC in 2050

All electricity generation and DAC projects could be developed while preserving the environment.

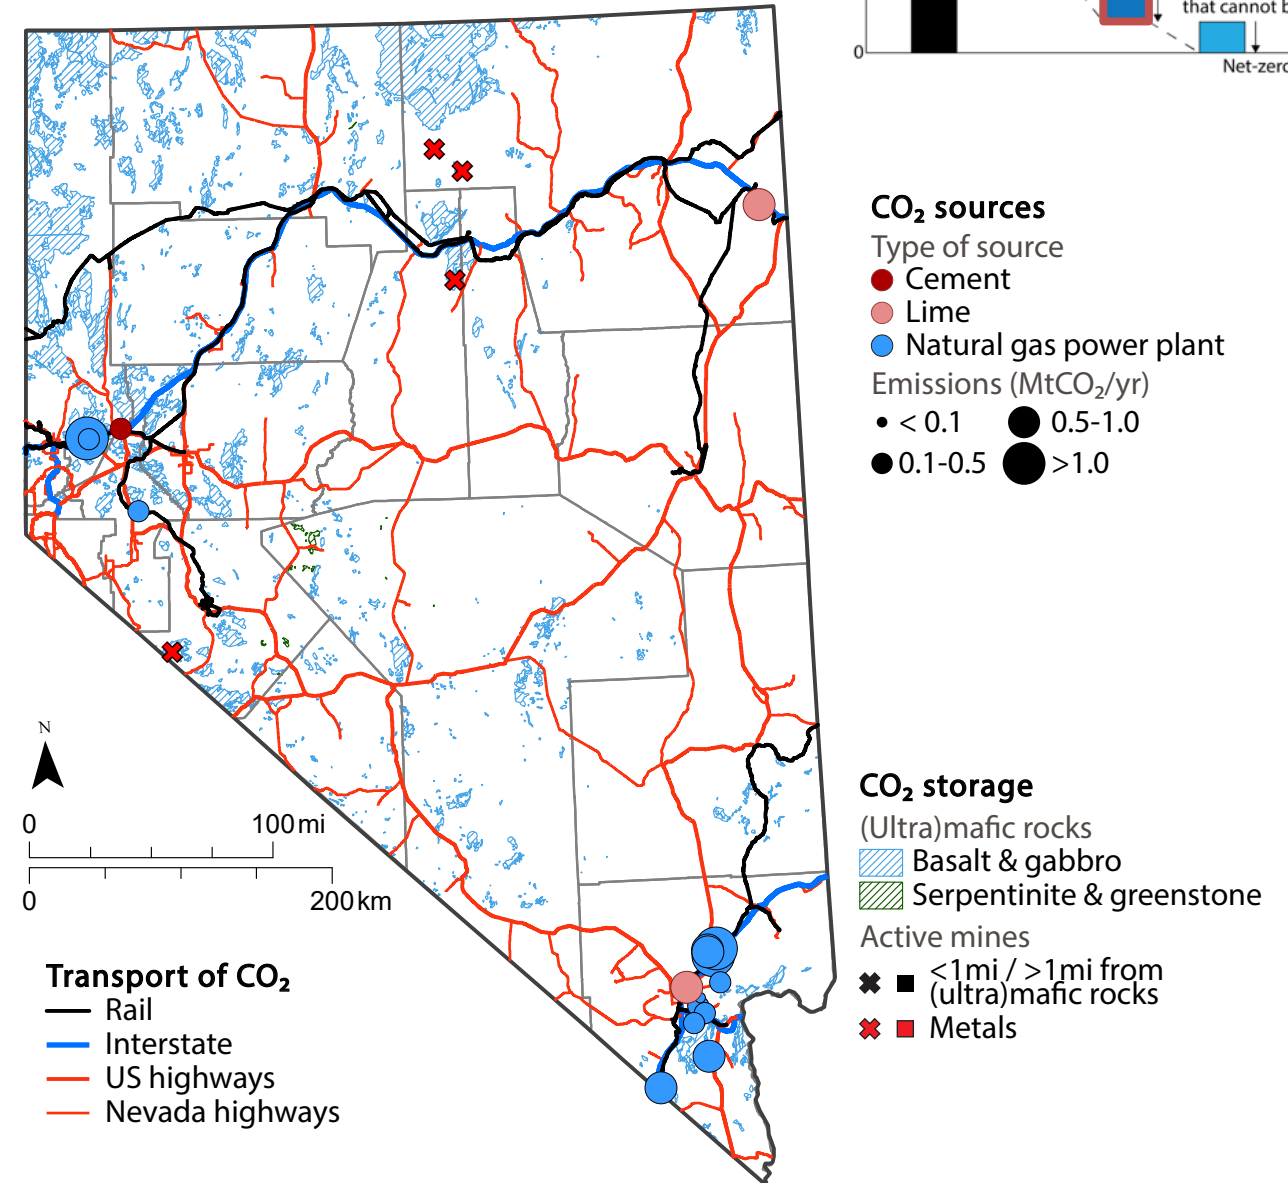

Land restriction levels from the “Power of Place” study indicates areas that would comply with (1) legal protections, (2) and administrative protections, (3) and high conservation value preservation, (4) and landscape intactness preservation.

# Avoiding CO<sub>2</sub> emissions

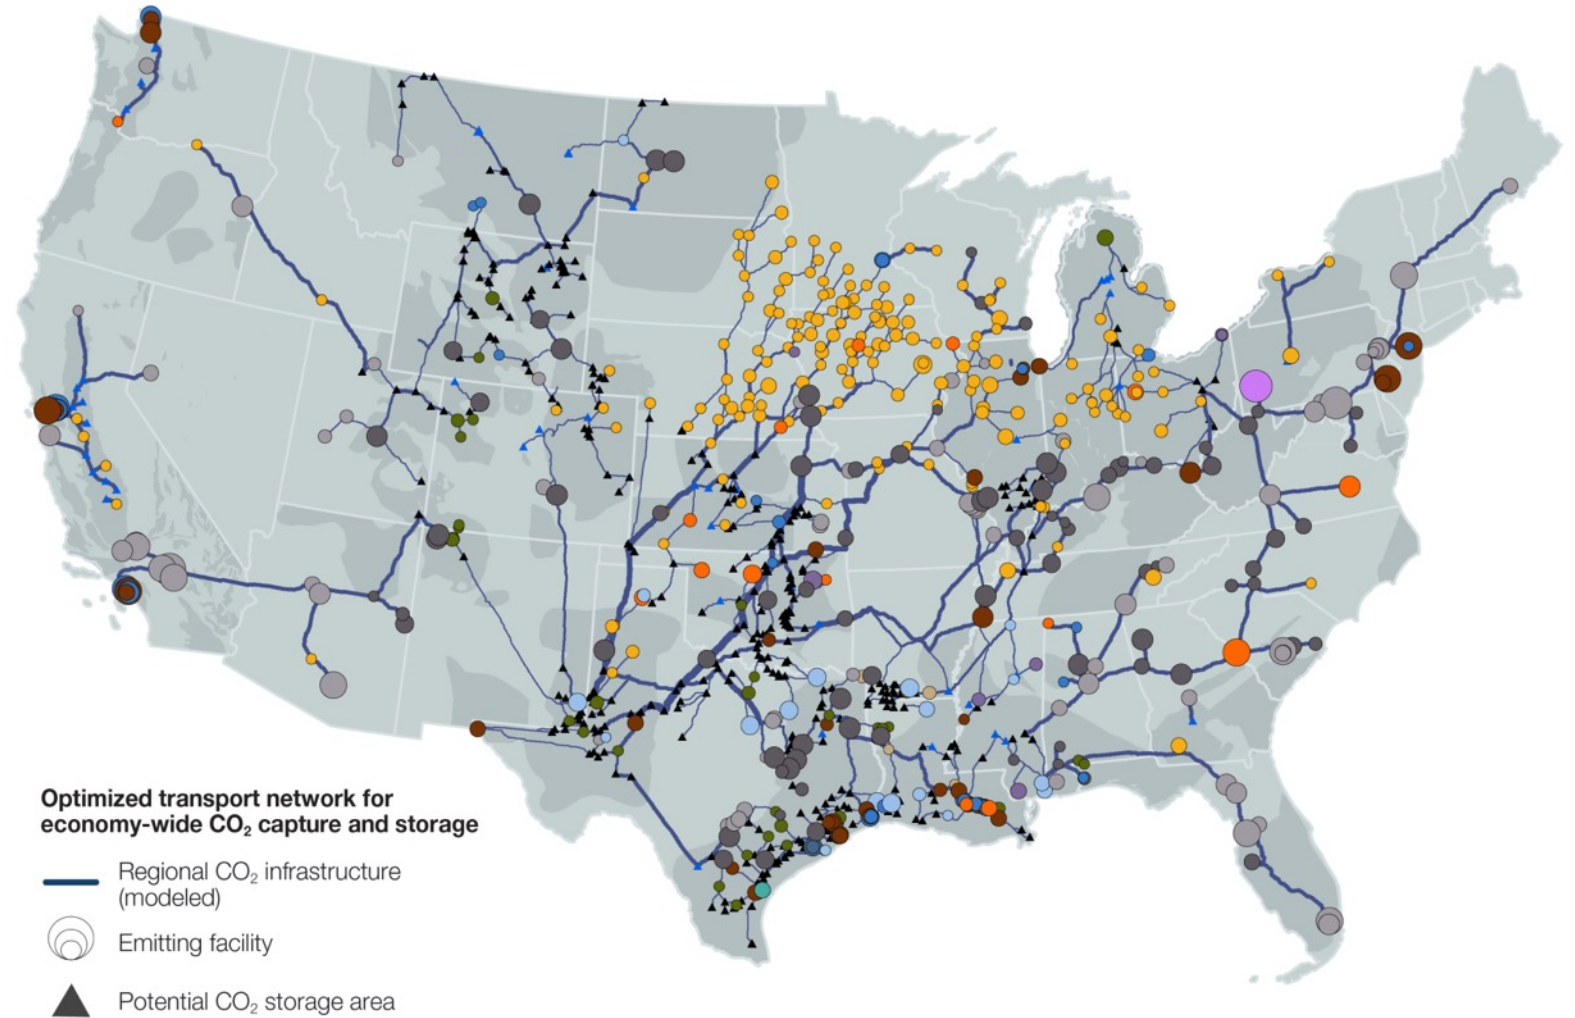

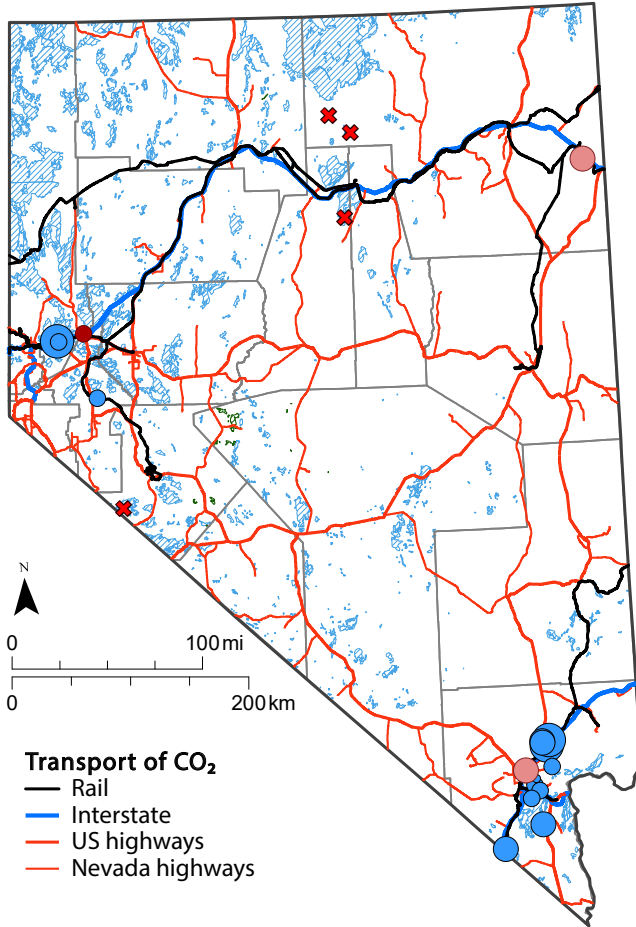

Avoiding CO<sub>2</sub> emissions  
=  
Point source carbon capture  
+  
Carbon storage

Transportation of CO<sub>2</sub> or alkaline  
feedstocks

# Understanding regional trends and opportunities

# Procedural recommendations

---

- assess (lifecycle assessments) and communicate (robust materials)
- developers: conduct SIA and EIA prior to site selection
- engage communities early in the planning process
- establish agreements to confer an equitable distribution of benefits to communities where CDR is to be sited

# Policy recommendations

---

- IIJA = 3.5B in DAC hubs
- DOE Carbon Negative Shot = all CDR  $\rightarrow$  \$100/tCO<sub>2</sub>
- IRA = boosts to 45Q, increased incentives for energy communities
- Justice40 = 40% of benefits flow to disadvantaged communities
  
- Encourage community engagements and agreements
- Establish job training programs and standards for high-quality employment
- Continue to support advanced RD&D
- Increase support for monitoring, reporting and verification (MRV)

A wide-angle photograph of a two-lane asphalt road with double yellow lines, curving gently into the distance. The road is flanked by sparse desert vegetation and leads towards a range of rugged, reddish-brown rock formations. The sky is filled with heavy, layered clouds in shades of orange, brown, and grey, suggesting a sunset or sunrise. The overall mood is one of a long, challenging journey.

**The road to net-zero is paved  
with hard problems**

# Removing CO<sub>2</sub> emissions

## Carbon dioxide removal (CDR)

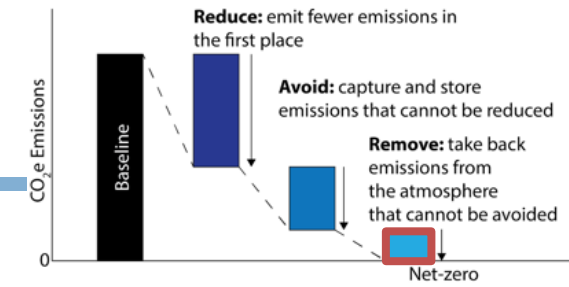

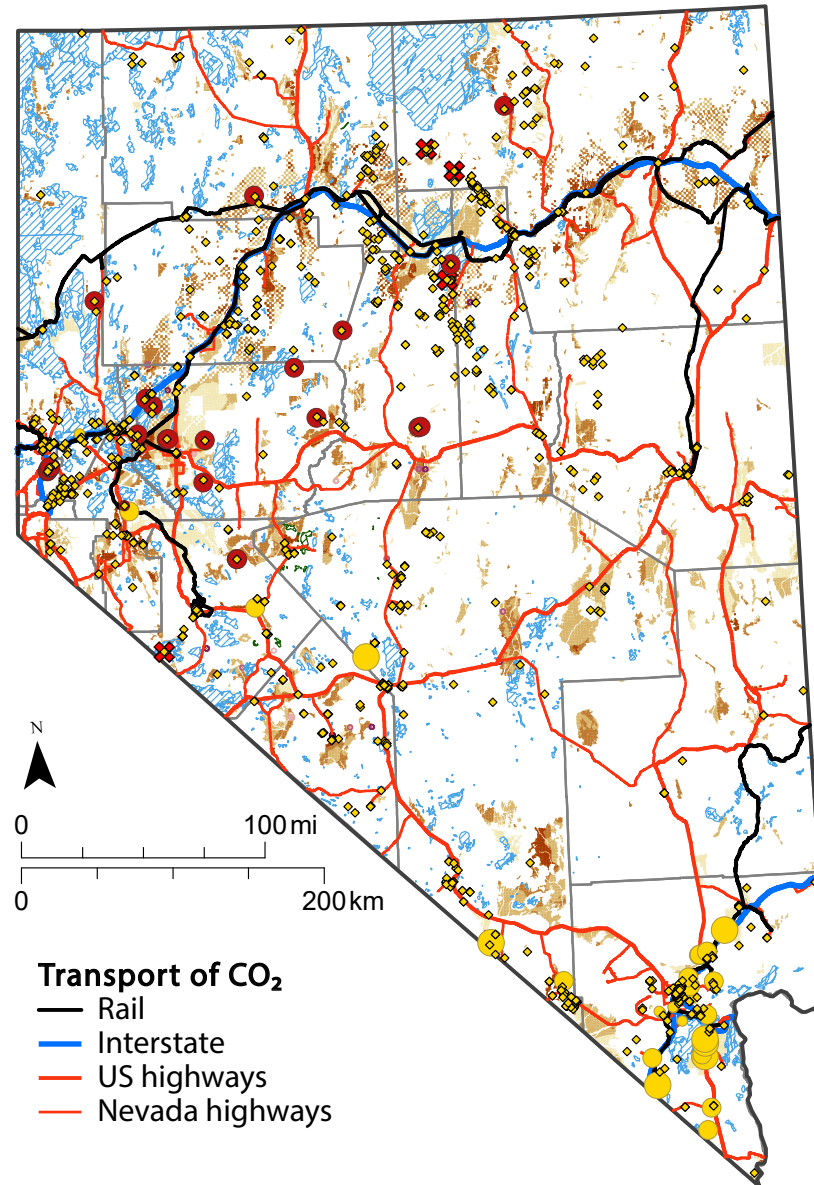

$$\begin{array}{c} = \\ \text{Direct air capture (DAC)} \\ + \\ \text{Carbon storage} \end{array}$$

## Siting of DAC

- Low-carbon renewable energy (thermal and/or electric)
- CO<sub>2</sub> storage or transportation infrastructure
- Critical habitats preservation
- Environmental justice considerations

Land restriction levels from the “Power of Place” study indicates areas that would comply with

- (1) legal protections,
- (2) and administrative protections,
- (3) and high conservation value preservation
- (4) and landscape intactness preservation.

## Energy

Operating power plants  
● Solar ● Geothermal

Capacity of power plants (MW)  
● <10 ● 10-100 ● 100-1,000

“Mining the Sun” study

## CO<sub>2</sub> storage

(Ultra)mafic rocks

Basalt & gabbro

Serpentinite & greenstone

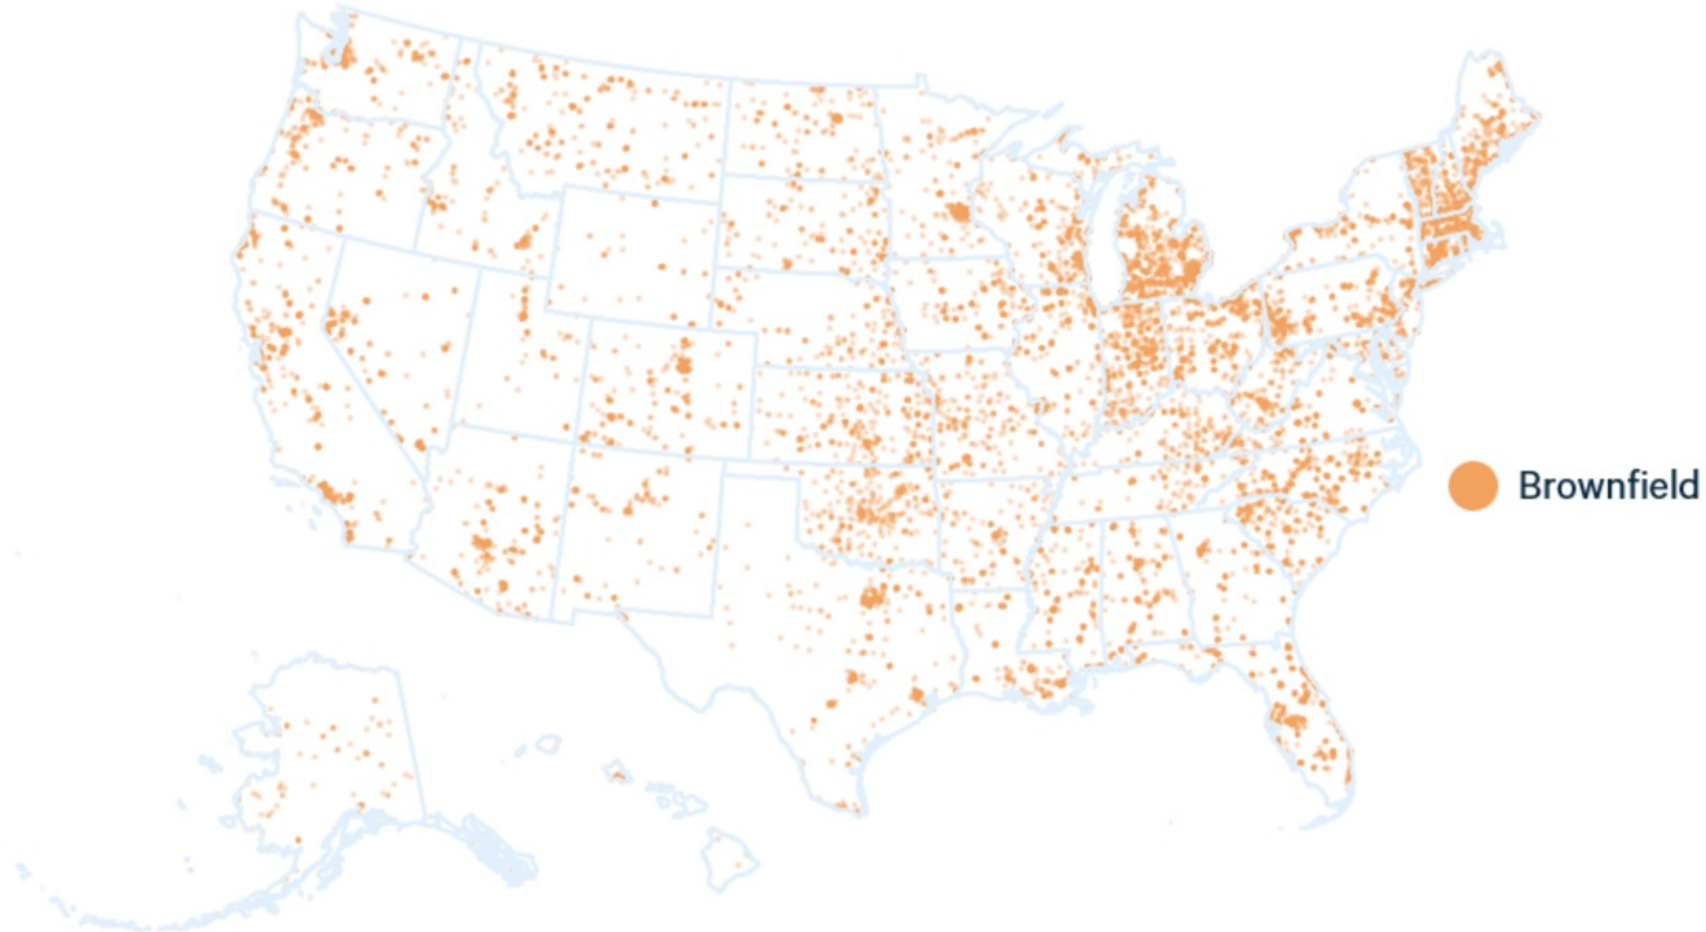

Active mines

✖ ■ <1mi / >1mi from (ultra)mafic rocks  
✖ ■ Metals

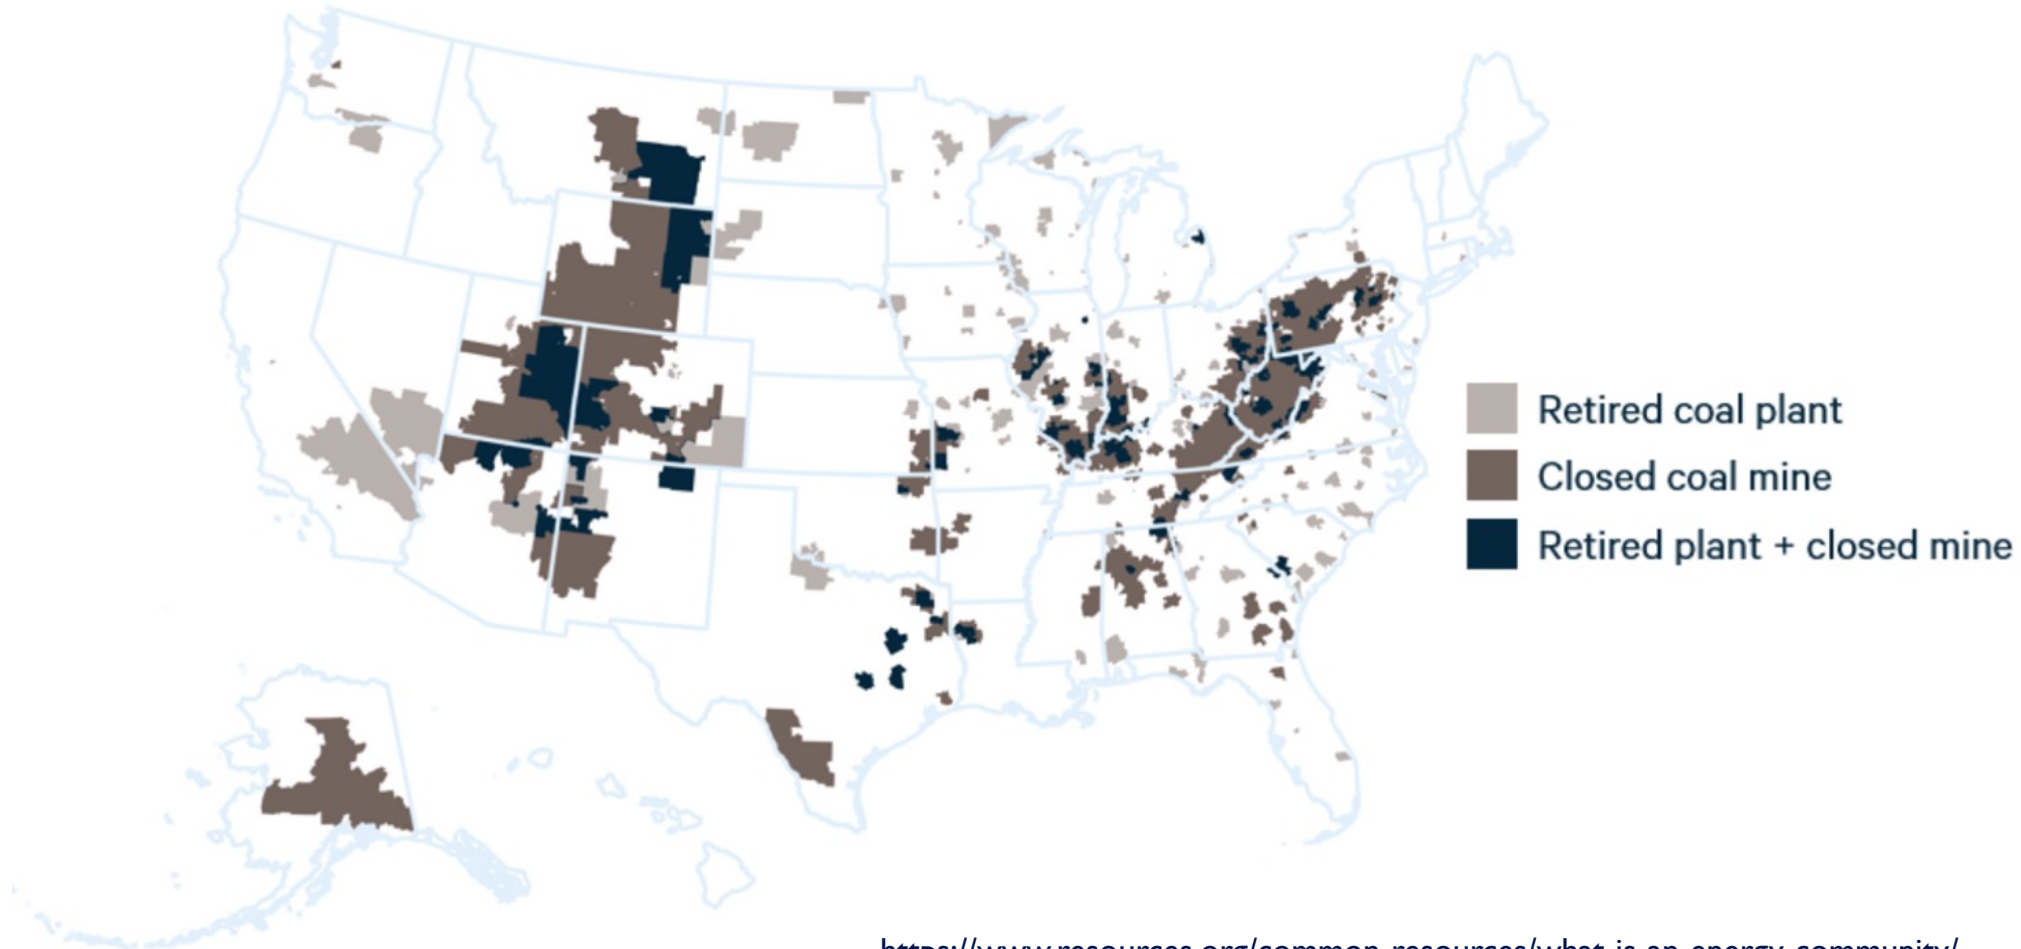

# Brownfields

Small parcels of pollution-contaminated land which, after designation as such by EPA, can receive funding for cleanup, reclamation.

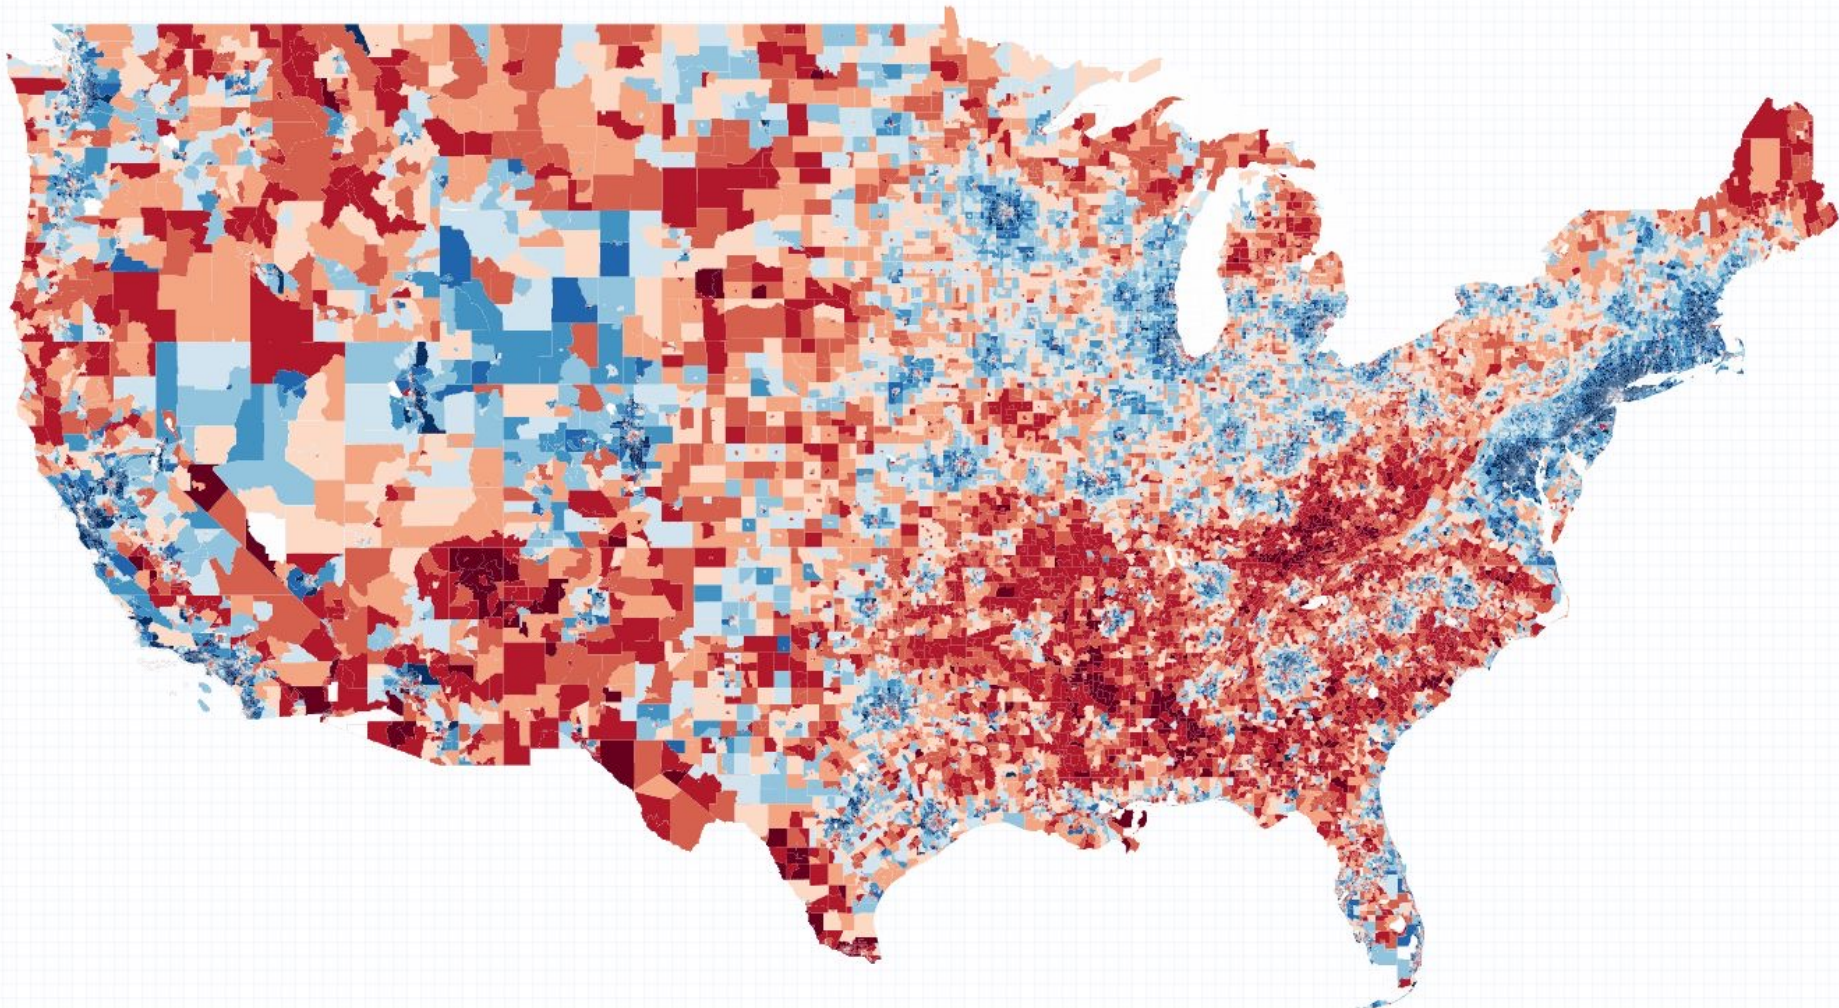

# Coal communities

Any census tract where a coal-fired power plant has closed since 2010, or a coal mine has closed since 2000.

# Coal communities

Any census tract where a coal-fired power plant has closed since 2010, or a coal mine has closed since 2000.

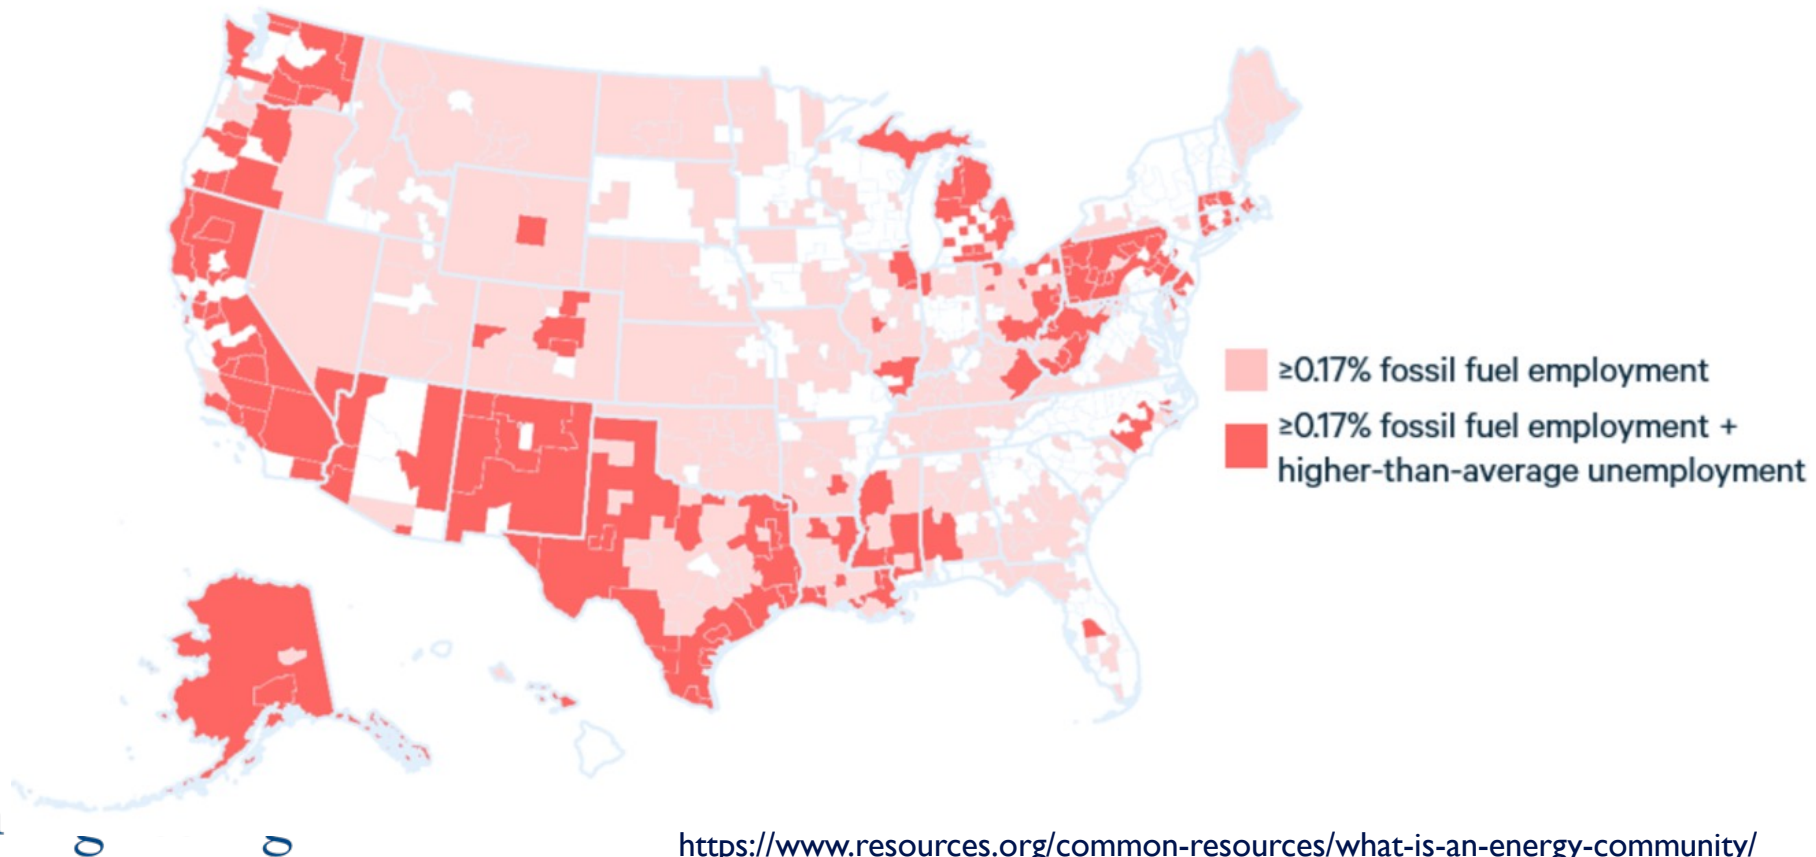

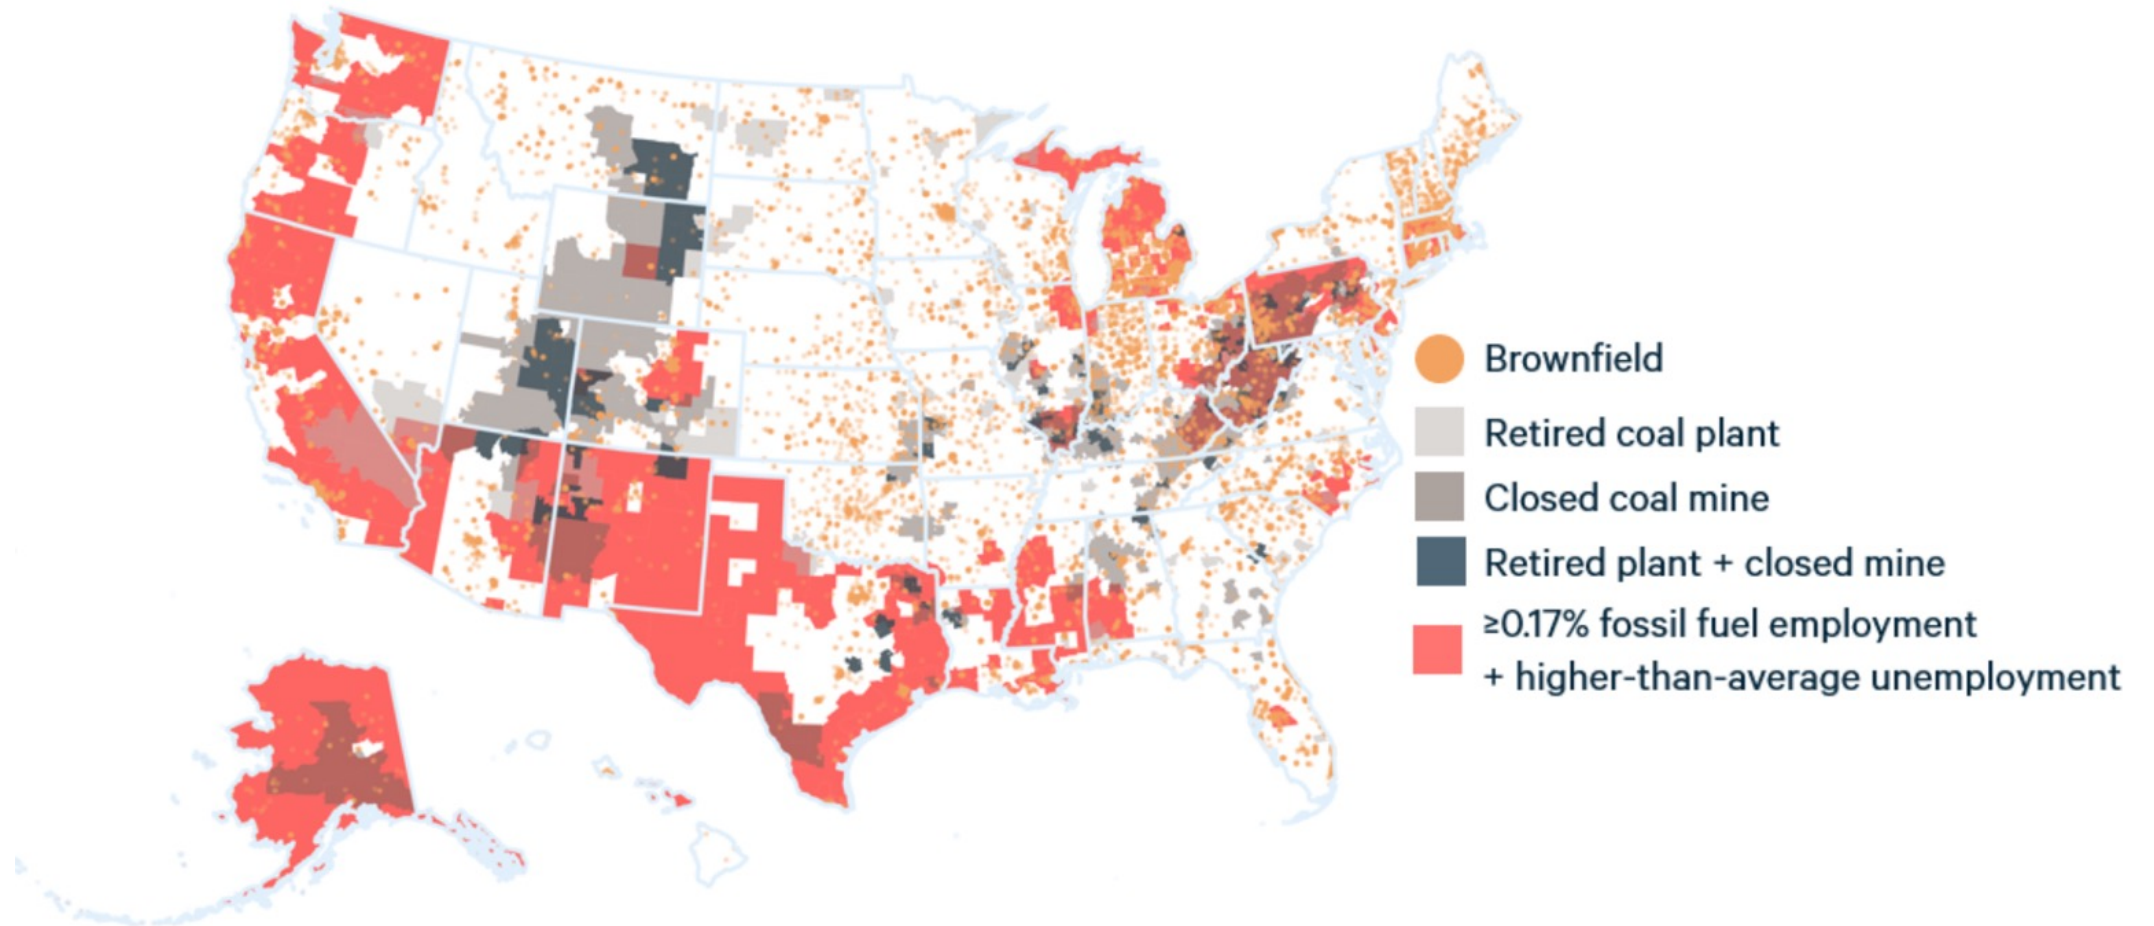

# Jobs and tax revenue

Area where **0.17%** or greater direct employment or at least 25% of local tax revenues [are] related to extraction, processing, transport, or storage of coal, oil, or natural gas”

AND  
“employment is **at or above the national average** in the previous year”. (5.3% in 2021)

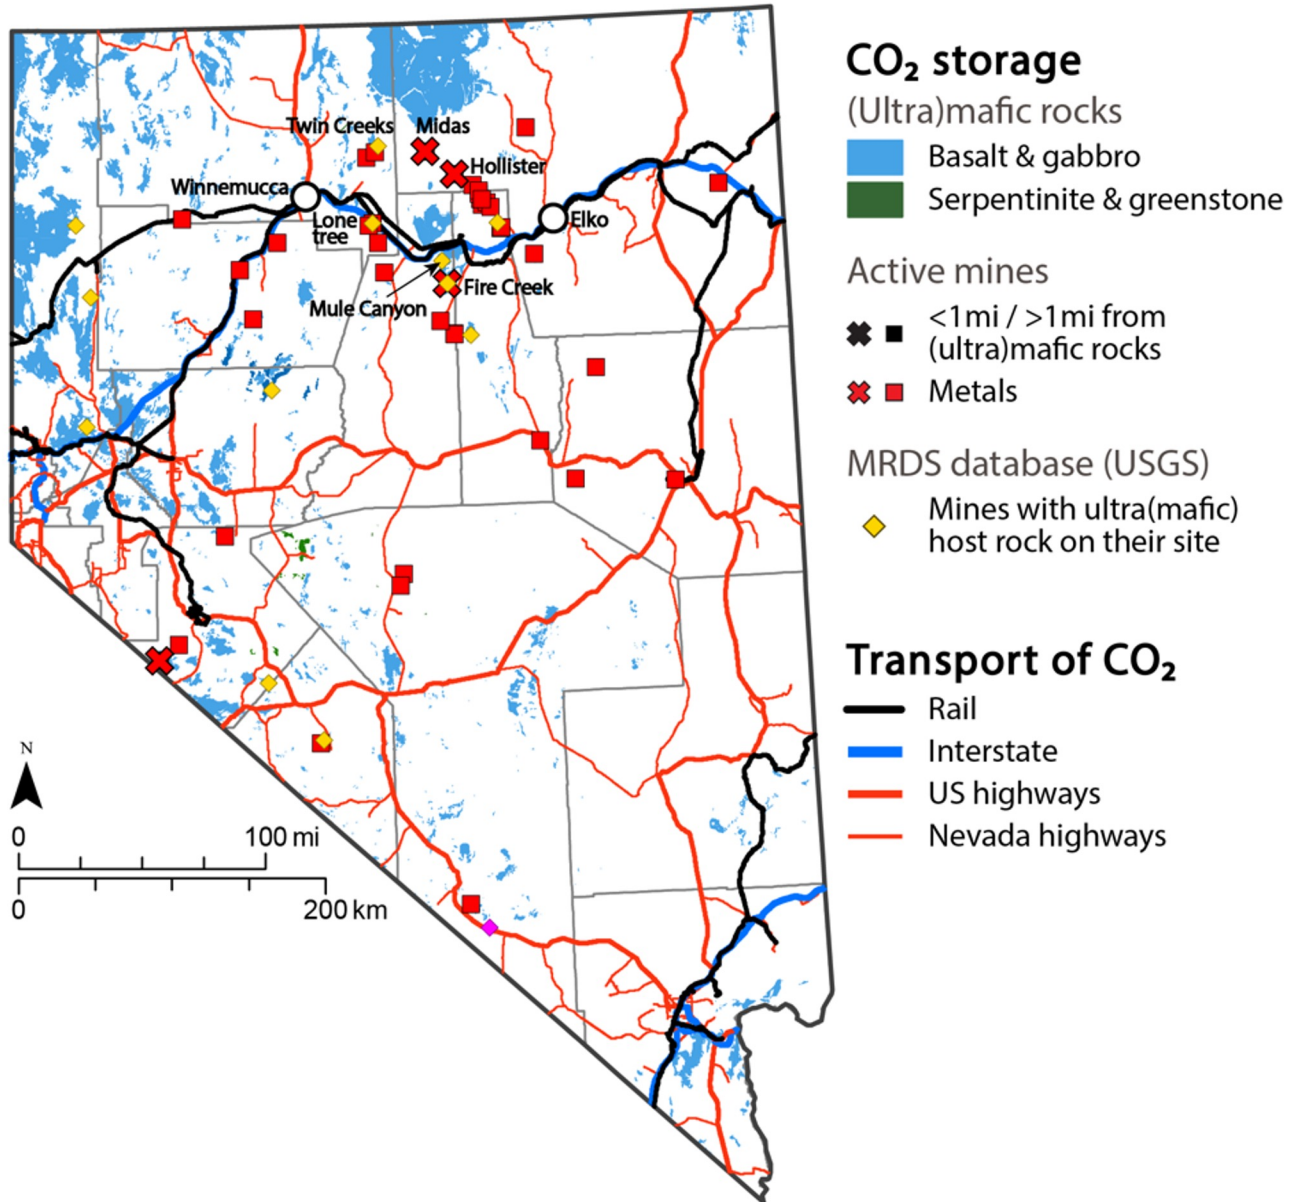

# Combined coverage

# Storage potential in Nevada

- Basalts are not deep enough for in-situ CO<sub>2</sub> injection
- Large amounts of mine tailings
  - Limited amount of mine tailings with alkalinity
  - Most of the mine tailings seem to be made of gypsum
- CO<sub>2</sub> captured in Nevada will likely need to be transported for storage elsewhere, unless
  - We find suitable sedimentary formations
  - Gypsum can be used in the carbon mineralization process

# A purely techno-economic approach shows DAC plant placement close to low-carbon energy and reliable storage sites

We might place DAC **here** to take advantage of low carbon thermal energy,

or **here** to take advantage of nearby storage opportunities,

**BUT ...**
